

with renewable energy!

We must observe and continue the traditions of our 70-year old Company Group, the culture of mutual respect, as well as the appreciation of our companies in our environment and by partners, and our recognition as a conservatively organised local company with reliable operation providing security.

HAJDU Group is recognised by our partners and customers, both in Hungary and abroad, as a reliable player in our economy, due mainly to our durable, excellent quality, reliable products.

All these have allowed, and will allow us in the future to ensure employment for our nearly 800 employees, as well as continuously growing living standard for their families.

Our aim is to further increase the good reputation and recognition of our companies building on our traditions.

> Lajos Novotni President of HAJDU Group

Electrical or electronic equipment included in this Product Catalogue contain components (for example, cables) which, after becoming waste, are classified as hazardous wastes. Hazardous substances in electrical, electronic equipment have a harmful impact on the environment (in particular, the soil and groundwater) and human health, if they are not used and operated in compliance with the relevant environmental regulations. Thus, you are requested to comply with the following requirements, in the interest environment protection:

- Electrical and electronic equipment that has become waste must be collected separately, it may not be placed in the same waste receptacle as municipal wastes, and it cannot be disposed of as municipal waste.
- You can leave used and waste electrical and electronic equipment free of charge at the point of sale, or with any distributor selling
 electrical and electronic equipment that is identical in nature with or has the same functionality as the used and waste electrical or
 electronic equipment.
- By proceeding this way, you can play a valuable role in the re-use, and preparation for re-use of electrical and electronic equipment, and in the reduction of the quantity, the recovery or other forms of recycling of electrical and electronic equipment that has become waste.
- As a manufacturer, we will bear all costs arising in connection with the fulfilment of the abovementioned obligations and expectations. Furthermore, we commit ourselves to paying these costs by issuing the present declaration.

HAJDU Zrt. reserves the right to implement changes. Valid from April 2022

ELECTRIC HOT WATER STORAGE TANKS

Z..., AQ..., C..., SY..., SMART, F...

Electric hot water storage tanks are designed to supply hot water needs. The tank of electric water heaters is made of steel, while protection against corrosion is ensured by a special titanium enamel coating and magnesium active anode. These appliances can supply multiple water withdrawal locations and faucets with shower. The thermal insulation of the appliances consists of freon-free polyurethane insulating foam. The versions with metal housing are applied nanoceramic surface pretreatment.

Our electric hot water storage tanks are available with HAJDU and AQUASTIC brand names, from 10 to 300 litres, and with various positioning options: wall mounted vertical, horizontal and floor-standing design.

The new generation units of the HAJDU CUBE and SMART series have self-learning system with SMART Control that enables increased efficiency and cost-effectiveness in the production of domestic hot water. The streamlined Aquastic FLAT models already have an accessible temperature regulator; these dual tank units can be installed both vertically and horizontally.

All new generation models are equipped with a ceramic (steatite) heater, whose great advantages include low scaling, longer service life and significantly lower servicing costs.

The **SMILEY** model features a special split ceramic heater. This unique design developed by HAJDU brings significant energy savings due to the possibility of heating the lower and upper parts of the tank to arbitrarily chosen, different temperatures.

INDIRECTLY HEATED HOT WATER STORAGE TANKS

AQ IDE...F, IND/IDE..., HR-N..., STXL..., STA..., AQ STA..., HD..., HB..., HPT...

Indirectly heated hot water tanks are available with volumes from 75 to 1000 litres. The domestic water in the tank is heated by the heat exchanger pipe coil in the tank.

They are available as wall mounted **F versions** and floor standing **S versions**.

- IND...F ErP Sztea and IND...S ErP Sztea indirectly heated hot water tank without electric heater
- IDE...F ErP Sztea and IDE...S ErP Sztea indirectly heated hot water tank with electric heater

The advantage of models with electric heating element is that they can provide domestic hot water without a boiler or solar collector. You can use the temperature controller to set the temperature of the hot water produced by the electric heater. Max. hot water temperature setting: 73°C.

The HRN high performance tanks enable heat-up by any heat generator appliance. Their heat exchanger has a large surface area, they are especially suited to low-temperature heating systems and condensing boilers. They come with an anode level indicator and a liquid tension thermometer.

High-performance STXL tanks are especially recommended for heat pump systems.

Multi-energy, high-capacity solar STA... tanks include, depending on the model, pipe coils in the lower third of the container (STA....C) or the lower and upper thirds of the container (STA....C2) that heat up the domestic hot water in the tank. Electric heaters can also be installed in the tank.

HD models **heated by an external heat exchanger** are recommended for use in heating centres at institutions and condominiums, and district heating substations. Hot water is produced in instantaneous mode, the tank is designed to relieve and balance withdrawal peaks. All members of this product line high pressure resistence and equipped with connections of large diameters.

HEAT PUMP APPLIANCES

HB..., HPT..., HPAW

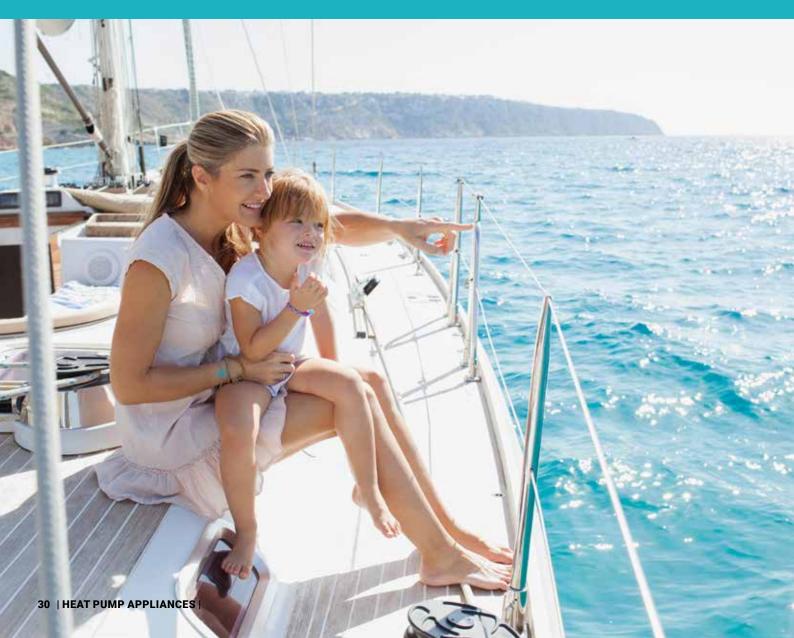

The heat pump of the **HB** model hot water tank uses the heat energy of air to heat up the water in the tank. **Appliance with** heat pump can produce at least 2 kW of heat from 0.5 kW of energy! This is the most efficient domestic hot water production method known today!

Interior rooms can be cooled using the air from the heat pump, and the ventilation of a room or home can also be supported by removing the cooled air. The appliance can also be connected to the ventilation system of the house. Thereby, in addition to domestic hot water production, these appliances can also be used to support ventilation, air conditioning and demisting. The **HB... C** type hot water tank with heat pump contains a lower heat exchanger enabling to connect directly to a solar system or boiler.

The **HB300C1** model includes an upper heat exchanger enabling to connect to the heating circuit, whereby it can be used in low temperature heating systems.

The **HP TOWER, HPT** series can be connected to an external solar system and integrated in a Smart Grid system.

Heat pump appliances; The **HPAW** air-to-water heat pump can provide a complete solution for heating, cooling and domestic hot water production in a wide range of environmental conditions. It is an ideal solution for both the setup and modernisation of state-of-the-art and environmentally friendly heating and air-conditioning systems in already existing and newly built properties. It can be added conventional, gas or other heating systems. It has a monobloc design, the heat pump and hydrobox are incorporated in a single housing.

PRODUCT FEATURES

- Energy efficient: Energy class A⁺!
- Suitable also for indoor cooling
- Smart Grid Ready
- Outer metal housing with nanoceramic finish and and titanium enamel coated inner tank surface
- Child lock, self-diagnostics
- Hidden electronic display
- Ergonomic design
- Simple, cheap installation
- Hidden air duct
- Hot-gas bypass defrosting
- Operation from solar cells
- Smart control pre-programmable for each day of one week

OPERATING MODES

- Only heat pump
- Heat pump or electric heating with automatic heat source selection
- Anti-legionella function at 65 °C (simultaneous heat pump and electric heating)
- Quick heat-up function (simultaneous heat pump and electric heating)
- Program
- Off peak
- Real time clock
- PV operation from solar cells

SENSORS

- Water temperature sensor
- Evaporator temperature sensor
- Air temperature sensor
- High pressure switch
- Safety thermostat

TEMPERATURE 4/6 KW

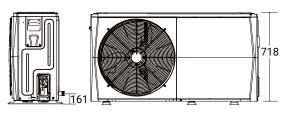

8/10/12/14/16 KW

BUFFER STORAGE TANKS

The energy store for buffer storage heating systems. Buffer storage tanks compensate for the differences between the times when energy is generated and when there is an actual energy demand, thereby ensuring efficient heating energy use.

The **PT...CF** models include an internal heat exchanger for the direct connection of heat generator equipment, and a flexible stainless steel heat exchanger with 500 to 1000 litres capacity for domestic hot water production.

The **AQ PT** models of 500 to 2000 litres capacity are available both without, and with single or double heat exchanger. The double heat exchanger versions allow greater flexibility when used with heat generator equipment.

The storage tanks have thermal insulation, which can be installed on site for volumes of at least 500 litres. This solution makes it easier to transport and install the tanks.

The PT HC models serve as the energy storage for heating and cooling systems. They are recommended primarily for heat pump systems. The buffer tank consists of a steel tank, polyurethane foam insulation, and plastic housing and lid. They are available in 100 and 200 litre empty design.

Gas-fired storage water heaters are available in two designs: **GB...1** chimney vented, and **GB...2**, non chimney vented. They are wall-mounted, closed system appliances that can supply multiple water withdrawal locations withdrawal locations and faucets with shower. The desired water temperature can be set using a knob. Non chimney vented models have the ODS (Oxigen Depletion Sensor) safety feature, i.e. the appliance will turn off before the oxygen content of air decreases to a level constituting health hazard.

HAJDU condensation gas boilers offer an all-round solution for setting up heating and hot water systems. Moreover, they are perfectly suitable for integration in solar systems. HAJDU HGK... and HGK Smart model condensation gas boilers come in wall-mounted design. A specially designed heat exchanger makes enables the production of heat and hot water independently from each other. The heat exchanger is made of aluminium and copper, which ensures a long service life. The application of the most advanced condensation technique results in the highest operational efficiency in this category, while also making the boiler environment-friendly. Since the appliance has neither a sequence valve nor a lamella heat exchanger, it does not require maintenance or replacement of these components either. They are compact appliance with small-footprint, easy and convenient to use, and they require minimum maintenance.

The control of the boiler allows the setting of three types of water heater functions, as needed (conventional – ON/OFF, Comfort – preheated heat exchanger, and ECO – self-learning).

These boilers can be connected to an indirect storage unit. They feature a highly energy-efficient modulation pump. The built-in RF module enables wireless remote control of the boilers via the use of a wireless radio frequency room thermostat. Accurate modulation and the special heat exchanger enable the boiler to function according to the customer's specific needs, whereby they can operate with high water-side efficiency in both heating and water heating mode. While normally running on natural gas (G20), they can be transformed to run on propane (G31).

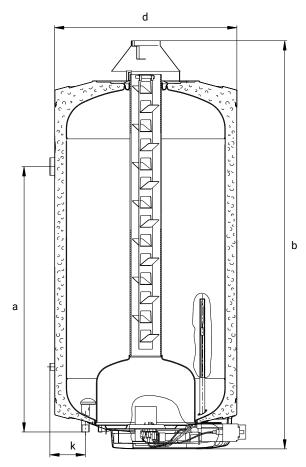

The appliances are available in versions with maximum heating power of 18, 23, 26, 28, 32 and 41 kW. For higher power requirements, cascading can be applied. The control electronics of the boilers have a built-in weather-aware regulator that enables optimal heating via the connection of an optional external temperature sensor. The boilers can be ordered with a radio frequency room thermostat, HAJDU flue gas deflectors, mounting brackets, as well as a closed expansion tank with safety valve.

GAS-FIRED HOT WATER STORAGE TANKS, CHIMNEY VENTED AND NON CHIMNEY VENTED DESIGN

*2 years full 5 year tank warranty

SOLAR COLLECTORS

M5 selective flat plate collectors

The **M5-210 flat plate collectors** contain 12 copper absorber tubes each with a diameter of 8 mm, and a selectively coated monolith absorber plate. The absorber plate is a 0,5 mm thick aluminium plate. It is ultrasonic welded to the tubes, which enables high heat transfer performance.

The collector has 40 mm thick heat insulation (made of rock wool with a density of 50 kg/m3) not only on the rear, but also on the sides.

The collector is covered by 3,2 mm thick tempered solar glass with reduced iron content. The glass has a triple seal: EPDM seal, silicone gel and a flexible fixing/clamping plate. The side wall of the collector, which is also a supporting structuralelement, is made of double-layer anodized aluminium. The back plate is made of anodized aluminium. The collector is fixed to the supporting structure by M8 screws. The screws can be freely moved in the rail formed on the sides of the collectors. The screws are factory-installed in the collector. There are two screws on both the lower left- and right-hand sides, and four screws at the top.

VTS evacuated tube collectors with parabolic reflector

Evacuated tube collectors consist of 1.5 m long evacuated tubes of 47 mm diameter. The tubes contain two concentric glass tubes. The vacuum between the tubes guarantees excellent insulation.

The inner tube comprises a sunray absorbing selective coating, copper absorber plate and a U-shapped copper tube filled with a mixture of antifreeze and water.

Collectors can be ordered with either 12 or 16 tubes. The aluminium parabolic reflective plate placed behind the tubes focuses sunrays to the tubes, thus making the collector more efficient.

SOLAR SYSTEMS

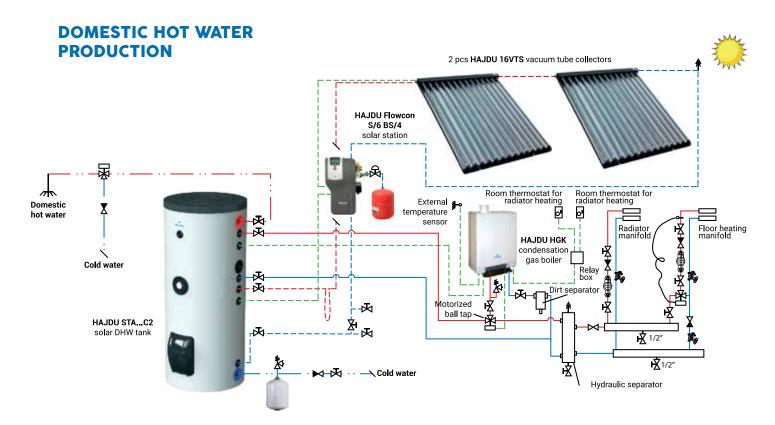

Solar collectors absorb sunrays and transform them into heat, which is then delivered to the antifreeze fluid circulated inside of it. The absorber surface of the collectors has a special selective coating, which guarantees high efficiency, good heat resistance and long service life. A pump helps to transfer the fluid from the collector to the hot water tank, where it passes the solar energy through an internal heat exchanger.

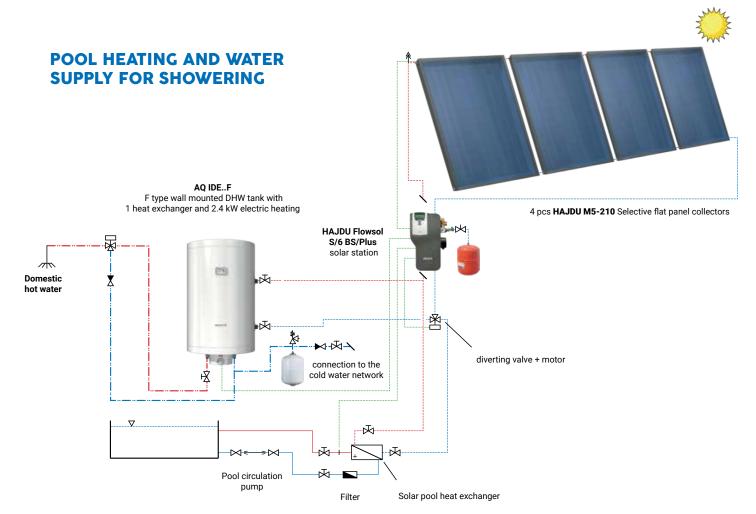

The functioning of the system is constantly monitored by a solar regulator that starts or stops the pump depending on the temperature measured by sensors.
